Examples for each lesson:

Lesson 2.1

Fractions and Decimals

Terminating decimals end. Repeating decimals do not end but have repeating digits. One way to convert a terminating decimal to a fraction or mixed number is to read the number.

Look at the decimal 5.75. The right-hand digit is in the hundredths place. Read 5.75 as “five and seventy-five hundredths.”

As a mixed number, the whole number is 5. The numerator is 75. The denominator is 100.

Write the fraction in simplest form using the greatest common factor.

\[ \frac{75}{100} - \frac{75}{25} = \frac{3}{4} \]

So, \(5.75 - \frac{3}{4}\) in simplest form.

Identify the decimal and the fraction in simplest form for point \(E\).

More information on this strategy is available on Animated Math Model #7.
Lesson 2.2

Divide by 1-Digit Divisors

You can use compatible numbers to help you place the first digit in the quotient. Then you can divide and check your answer.

Divide. \( \frac{41}{757} \)

**Step 1** Estimate with compatible numbers to decide where to place the first digit. 
\[
\begin{align*}
757 \div 4 & \quad 600 \div 4 = 200 \\
41 \quad 44 & \\
17 & \\
-16 & \\
\hline
37 & \\
-32 & \\
\hline
5 & \\
-4 & \\
\hline
1 &
\end{align*}
\]

The first digit of the quotient is in the hundreds place.

Since 189 is close to the estimate of 200, the answer is reasonable.
So, \( \frac{41}{757} \div 4 = 189 \frac{r1}{8} \).

More information on this strategy is available on Animated Math Model #8.

Lesson 2.3

Multiply Fractions

To multiply fractions, you can multiply numerators and multiply denominators. Write the product in simplest form.

Find \( \frac{3}{10} \times \frac{4}{5} \)

**Step 1** Multiply numerators. Multiply denominators.
\[
\begin{align*}
\frac{3 \times 4}{10} & \quad \frac{3 \times 4}{5} = 12 \\
10 & \quad 5 \\
\hline
\frac{12}{50} & \quad \frac{50}{25} = 2.25 \\
\hline
\end{align*}
\]

So, \( \frac{3}{10} \times \frac{4}{5} = \frac{6}{25} \).

To simplify an expression with fractions, follow the order of operations as you would with whole numbers.

Find \( \frac{5}{7} - \frac{3}{14} \times \frac{1}{10} \)

**Step 1** Perform the operation in parentheses. To subtract, write an equivalent fraction using a common denominator.
\[
\begin{align*}
\frac{5}{7} - \frac{3}{14} \times \frac{1}{10} & \quad \frac{5}{7} - \frac{3}{14} \times \frac{1}{10} \\
(10 - 3) \times \frac{1}{10} & \quad (10 - 3) \times \frac{1}{10} \\
= 7 \times \frac{1}{10} & \quad = 7 \times \frac{1}{10} \\
\hline
\frac{7}{14} \times \frac{1}{10} & \quad \frac{7}{14} \times \frac{1}{10} \\
\hline
\frac{7}{140} & \quad \frac{1}{20} \\
\hline
\end{align*}
\]

So, \( \frac{5}{7} - \frac{3}{14} \times \frac{1}{10} = \frac{1}{20} \).

More information on this strategy is available on Animated Math Model #9.
Lesson 2.4

**Simplify Factors**

Sometimes you can simplify before you multiply fractions.

Find the product of $\frac{5}{6} \times \frac{4}{15}$. Simplify before multiplying.

**Step 1** Rewrite as a single fraction.

$$\frac{5 \times 4}{6 \times 15}$$

**Step 2** Look for numbers in the numerator that have common factors with numbers in the denominator.

Find the GCF.

The GCF of 5 and 15 is 5.
The GCF of 6 and 4 is 2.

**Step 3** Divide.

$$\frac{5 \div 5}{15 \div 5} \div \frac{6 \div 2}{4 \div 2} = \frac{1}{3} \times \frac{2}{3}$$

**Step 4** Rewrite the fraction with the new numbers. Multiply the numerators. Multiply the denominators.

$$\frac{1 \times 2}{3 \times 3} = \frac{2}{9}$$

So, $\frac{5}{6} \times \frac{4}{15} = \frac{2}{9}$.

Lesson 2.5

**Model Fraction Division**

Use fraction strips to find $\frac{1}{2} \div 3$.

**Step 1** $\frac{1}{2} \div 3$ can mean divide $\frac{1}{2}$ into 3 equal parts and find how much is in each part. Find a fraction strip such that 3 of that strip make the same length as a single $\frac{1}{2}$ strip.

**Step 2** There are three $\frac{1}{6}$ strips in $\frac{1}{2}$, so $\frac{1}{2} \div 3 = \frac{1}{6}$. 

![Fraction Strips](image-url)
Lesson 2.6

**Estimate Quotients**

You can use compatible numbers to help you estimate the quotient of fractions and mixed numbers.

**Example 1:** Estimate $19\frac{5}{7} \div 3\frac{4}{5}$ using compatible numbers.

**Step 1** Find whole numbers that are close to $19\frac{5}{7}$ and $3\frac{4}{5}$ that are easy to divide mentally.

Think: $19\frac{5}{7}$ is close to 20, and $3\frac{4}{5}$ is close to 4.

**Step 2** Rewrite the problem and then divide: $20 \div 4 = 5$

So, the estimated quotient is 5.

**Example 2:** Estimate $6\frac{1}{5} \div \frac{3}{4}$ using compatible numbers.

**Step 1** Rewrite the problem using compatible numbers: $6 \div \frac{1}{2}$

**Step 2** Divide. Think: How many halves are in 6 wholes? 12

So, the estimated quotient is 12.

More information on this strategy is available on Animated Math Model #10.

Lesson 2.7

**Divide Fractions**

You can multiply by reciprocals to divide fractions.

**Write the reciprocal of $\frac{1}{7}$**.

To find the reciprocal of a number, switch the numerator and the denominator.

Since $\frac{1}{7} \times \frac{7}{1} = 1$, the reciprocal of $\frac{1}{7}$ is $\frac{7}{1}$.

**Find the quotient of $\frac{4}{5} \div \frac{1}{4}$. Write it in simplest form.**

**Step 1** Find the reciprocal of the second fraction. Think: $\frac{1}{4} \times \frac{4}{1} = 1$.

**Step 2** Write a multiplication problem using the reciprocal of the second fraction. The reciprocal of $\frac{1}{4}$ is $\frac{4}{1}$.

**Step 3** Multiply. $\frac{4}{5} \times \frac{4}{1} = \frac{16}{5}$

**Step 4** Simplify. $\frac{16}{5} = \frac{3\frac{1}{5}}{5}$

So, $\frac{4}{5} \div \frac{1}{4} = \frac{3\frac{1}{5}}{5}$.
Lesson 2.8

Model Mixed Number Division

Use pattern blocks to find the quotient of $\frac{3\frac{1}{2}}{\frac{1}{6}}$.

Step 1 Model $3\frac{1}{2}$ with 3 hexagon blocks.
  Model $\frac{1}{2}$ with 1 trapezoid block.

Step 2 Find a block that shows $\frac{1}{6}$.
  6 triangle blocks are equal to 1 hexagon.
  So, a triangle block shows $\frac{1}{6}$.

Step 3 Cover your model with triangle blocks.
  Count the triangles.
  There are 21 triangle blocks.

So, $3\frac{1}{2} \div \frac{1}{6} = 21$.

Lesson 2.9

Divide Mixed Numbers

To divide mixed numbers, first rewrite the mixed numbers as fractions greater than 1. Then multiply the dividend by the reciprocal of the divisor.

Find the quotient of $7\frac{1}{2} \div 2\frac{1}{2}$. Write it in simplest form.

Step 1 Write the mixed numbers as fractions.
  $7\frac{1}{2} = \frac{15}{2}$
  $2\frac{1}{2} = \frac{5}{2}$

Step 2 Use the reciprocal of the divisor to write a multiplication problem.
  $\frac{15}{2} \times \frac{2}{5}$
  $\frac{15}{1} \times \frac{2}{5}$

Step 3 Simplify. Look for common factors in the numerators and denominators. Divide out the common factors.
  $\frac{3}{1} = 3$

Step 4 Multiply and simplify the product.
  $3 \div 3 = 3$

So, $7\frac{1}{2} \div 2\frac{1}{2} = 3$.

More information on this strategy is available on Animated Math Model #11.
Lesson 2.10

Problem Solving • Fraction Operations

Draw a model to solve the problem.

Naomi cuts a 3/2-foot paper roll into sections, each 1/16 foot long. If she discards 1/6 foot of the roll, how many sections does she still have?

<table>
<thead>

Vocabulary

**Multiplicative inverse** – one of two numbers whose product is 1

**Reciprocal** – one of two numbers whose product is 1

**Repeating decimal** – a decimal number that has a block of one or more digits that repeat continuously (where all digits in the block are not zero)

**Terminating decimal** – a decimal number that ends, or terminates

**Benchmark** – a familiar number used as a point of reference

**Compatible numbers** – numbers that are easy to compute with mentally

**Common denominator** – a common multiple of the denominators or two or more fractions

**Equivalent fractions** – two or more fractions that name the same amount

**Mixed number** – a number represented by a whole number and a fraction

**Simplest form** – a fraction in which 1 is the only number that can divide evenly into the numerator and the denominator
